
Integrating Cisco Unified Communications Applications (CAPPs)

Guide Version 1.0

Abdul Jaseem VP
CAPPs Guide 1.0 (16 Pages)
(Release Date 21/Mar/2016)

Warning!

Duplicating or copying exact content from this guide strictly prohibited.

Syllabus

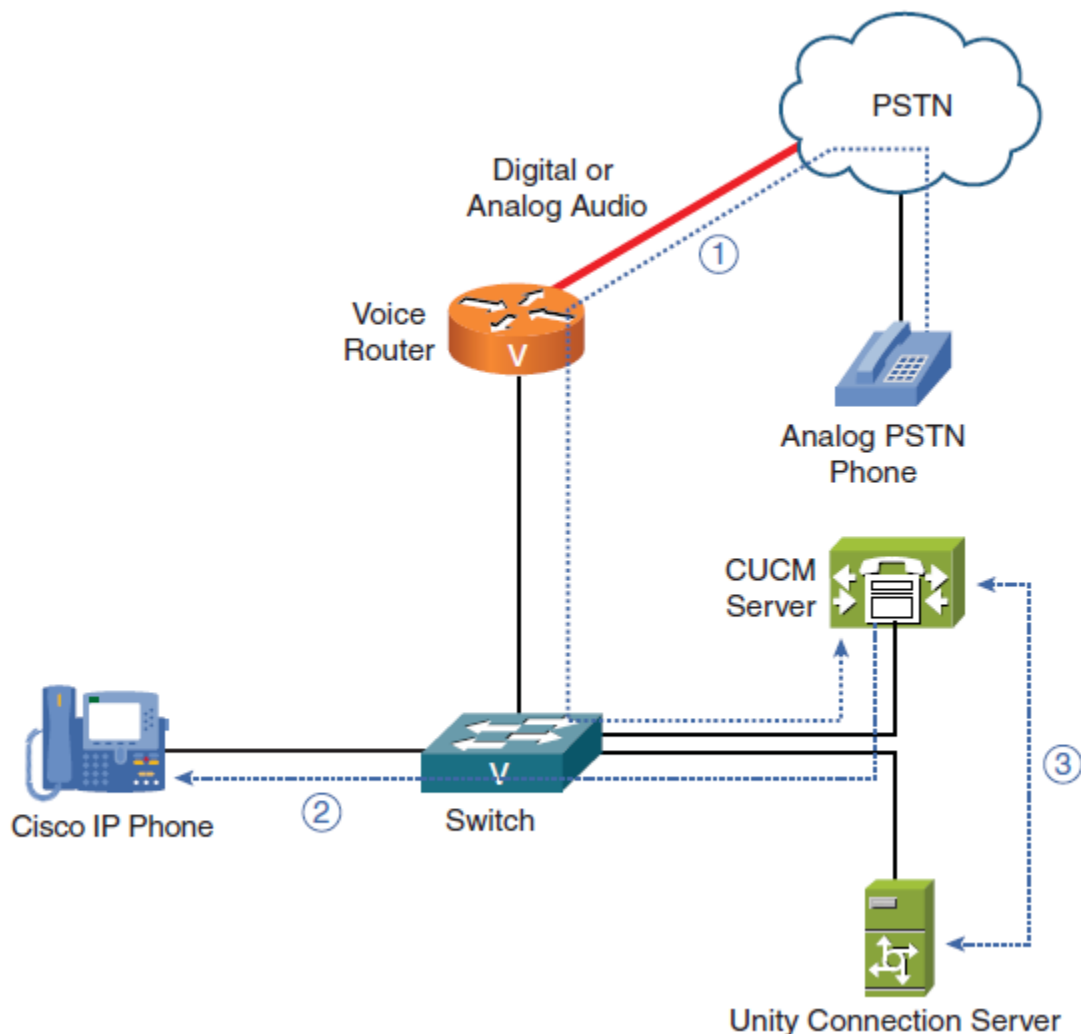

- What is Cisco Unity Connection (CUC)?
- Call Flow between CUCM and CUC
- Call Handlers
- Integrate Cisco Unity Connection and Cisco Unified Communications Manager
- Configure Cisco Unity Connection system settings
- User Configuration in CUC

Cisco Unity Connection (CUC)

- CUC is a full featured voice messaging and voice recognition system providing universal access to calls and messages as part of unified communications. Up to 20,000 mailbox users can be supported by Cisco Unity Connection
- CUC can be integrated to legacy PBX using T1 IP Media Gateway (TIMG- T1 to SIP), PBX IP Media Gateway (PIMG- provides 8 analog connections)
- CUC Users: Manual, CSV, CUCM Import, LDAP
- CUC can be integrated to CUCM by SCCP or SIP
- Access Methods: CUC provides Traditional User Interface (TUI: DTMF Relay), Voice User Interface (VUI: Voice Response and hands free interaction), IP Phone based Voice View Express to list voice mail in IP Phone's screen.

Call Flow between CUCM and CUC

CUC can interact with CUCM by SCCP or SIP signaling protocols.

1. An incoming call from PSTN arrives at voice gateway; the dial-peer configured on the gateway routes the call in to CUCM server
 2. CUCM receives the call and rings proper IP phone. If the user doesn't answer the phone or diverted the calls to Voice mail, CUCM forwards the call to preconfigured extension number that reaches to Cisco Unity Connection
 3. CUCM deliver the call to Unity Connection Server. The extension of originally called phone is contained in the signaling messages, which allows CUC to send the call to correct voice mail
- After caller leaves voice mail, CUC makes a logical call back to the MWI number on CUCM. It lights the message waiting indicator on the IP Phone.
 - All these interaction between CUCM and CUC done using Voice Mail Ports, which are licensed feature. The more voice mail port license you purchase from Cisco, the more concurrent communication it supports.

Call Routing in CUC

- Two primary call routing criteria built in to CUC. It can identify Directed calls and Forwarded calls.
- Directed call is when the user hits Message button or dials Voice mail pilot number.
- Forwarded call is when user forwards to voice mail
- The information available in CUC for this decision making includes the following - (Calling Number, Called Number, Forwarded station, Phone system/Port, Schedule)

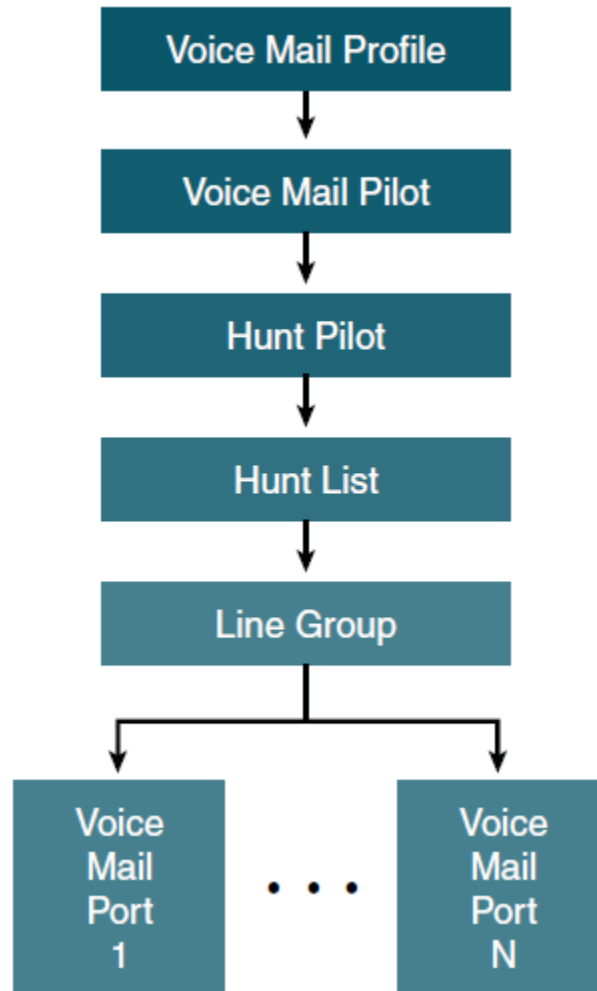

Call Handlers

All inbound calls to CUC are handled by series of call handlers. 3 basic types of call handlers are follows,

- **System Call Handler:** Used for greeting and can be customized to offer user input options (For Sales, press 2) and automation such as playing different greetings when business closed.
- **Directory Handler:** Allows caller to search the CUC directory for the user they want to contact
- **Interview Handler:** Provide caller with recorded information and then ask question and record callers answers in a single message.

SCCP Integration CUC to CUCM

- SCCP Integration is done by using a Hunt Pilot number. That is exactly the voice mail pilot number (Connection to CUCM)

CUCM Side

Step 1: Message Waiting Indicator

Advanced Features → Voice Mail → Message Waiting → Add New

(Create ON & OFF numbers, The extension number should be other than internal extension numbers)

Message Waiting Configuration	
<div>  Save  Delete  Copy  Add New </div>	
Status <div>  Status: Ready </div>	
Message Waiting Information	
Message Waiting Number*	9990
Partition	< None >
Description	MWI_ON

Step 2: Configure Voice Mail Port

Advanced Features → Voice Mail → Cisco Voice Mail Port Wizard

Add ports to a new Cisco Voice Mail Server using this name: CiscoUM1

System ▾ Call Routing ▾ Media Resources ▾ Advanced Features ▾ Device ▾ Application ▾ Us

Steps

- Add a new voice mail server
- Add ports
- Configure device information for ports
- Configure Directory Numbers
- Configure Line Group
- Confirmation
- Summary

Cisco Voice Mail Server

Add ports to a new Cisco Voice Mail Server using this name: CiscoUM1

Click Next →

How many ports do you want to add? : 2

Description : Voice-Mail-Port

Device Pool* : <Select Proper Device Pool>

Device Security Mode : Non Secure Voice Mail Port

Device Information

Description	Voice-Mail-Port
Device Pool*	Default ▾

Click the radio button Yes. Add directory numbers to a new Line Group.

Do you want to add these directory numbers to a Line Group?

For using these ports, you need to add corresponding directory numbers to a line group. you can do so by using Line Group configuration option.

☒ Yes. Add directory numbers to a new Line Group.

☐ Yes. Add directory numbers to an existing Line Group.

☐ No. I will add them later.

→ Next

Line Group Name: Voice-Mail-Line-Group

Line Group

Enter the Line Group settings for Cisco Voice Mail Server
